

Open Headset Interconnect Standard

An interface standard to allow any headset to connect to any radio.

OHIS provides an open ("Free" as in Speech) standard for microphone, headphone, and PTT signals (plus power) in a single cable and common connector. In multi-user environments such as club stations, contest stations, or EOCs, a standard headset interface allows any user to connect their own headset to any radio, without needing an adapter specific to that headset/radio pair.
